

POWER OPTIONS

Selecting the right power option should be determined by the distance from the gate to the nearest power supply.
Here's a quick guide:

0 – 1m: A new build may get mains power installed at the gate.

1 – 35m: For larger properties, Extended Transformers remove the need for expensive trench work to bury mains power cable.

35m+: As solar is its own power supply this option suits large properties, semi-rural & rural properties.

240V POWER POINT

Connect the motor directly to mains power. Note: Power point needs to be <1m from motor.

EXTENDED TRANSFORMER

The power box can be mounted up to 35m from the gate, into a new or existing power point. Power box connects power to the gate automation via low voltage 24v garden light cable.

SOLAR POWER

The purpose of solar is less about green energy, more about providing power where it's not practical to run cable.
